Chapter 1

Introduction

In this document you will find some exercises about these sections:

- $\bullet \ \ Data \ Manipulation \ with \ dplyr$
- $\bullet \quad Data \ \ Visualization \ with \ ggplot 2$
- $\bullet \quad \textit{Writing} \,\, R \,\, \textit{functions}$

Chapter 2

Data Manipulation with dplyr

Load dplyr package, supposing it is already installed.

```
require(dplyr)
```

2.1 Data

All the following exercises are based on the nycflights13 data, taken from the nycflights13 package.

So first of all, install and load this package

```
install.packages("nycflights13")
require(nycflights13)
```

The nycflights13 package contains information about all flights that departed from NYC (e.g. EWR, JFK and LGA) in 2013: 336,776 flights in total.

```
ls(pos = "package:nycflights13")
## [1] "airlines" "airports" "flights" "planes" "weather"
```

To help understand what causes delays, it includes a number of useful datasets:

- flights: information about all flights that departed from NYC
- weather: hourly meterological data for each airport;
- planes: construction information about each plane;
- airports: airport names and locations;

• airlines: translation between two letter carrier codes and names.

Let us explore the features of flights datasets, which will be used in the following exercises.

```
data("flights")
```

2.1.1 flights

This dataset contains on-time data for all flights that departed from NYC (i.e. JFK, LGA or EWR) in 2013. The data frame has 16 variables and 336776 observations. The variables are organised as follow:

- Date of departure: year, month, day;
- Departure and arrival times (local tz): dep_time, arr_time;
- Departure and arrival delays, in minutes: dep_delay, arr_delay (negative times represent early departures/arrivals);
- Time of departure broken in to hour and minutes: hour, minute;
- Two letter carrier abbreviation: carrier;
- Plane tail number: tailnum;
- Flight number: flight;
- Origin and destination: origin, dest;
- Amount of time spent in the air: air_time;
- Distance flown: distance.

```
dim(flights)
```

```
## [1] 336776 16
```

head(flights)

```
year month day dep_time dep_delay arr_time arr_delay carrier tailnum flight

2.5 Mutate

2.5.1 Exercise 1

Add the following new variable to the flights dataset:

• the speed in miles per hour, named speed (distance / air_time * 60).

Consider that times are in minutes and distances are in miles.

```
mutate(flights, speed = distance / air_time * 60)
```

```

2.5.2 Exercise 2

Add the following new variables to the flights dataset:

mutate(flights, gain = arr_delay - dep_delay,
 gain_per_hour = gain / (air_time / 60))

- the gained time in minutes (named gain), defined as the difference between delay at departure and delay at arrival;
- the gain time per hours, defined as gain / (air_time / 60)

```

Chapter 3

Data Visualization with ggplot2

Load ggplot2 package, supposing it is already installed.

```
require(ggplot2)
```

3.1 Data

3.1.1 iris

Almost all the following exercises are based on the iris dataset, taken from the datasets package.

It is a base package so it is already installed and loaded.

```
data("iris")
```

This dataset gives the measurements in centimeters of length and width of sepal and petal, respectively, for 50 flowers from each of 3 species of iris. The species are Iris setosa, versicolor, and virginica.

iris dataset contains the following variables:

- Sepal.Length: length of iris sepal
- Sepal.Width: width of iris sepal
- Petal.Length: length of iris petal
- Petal.Width: width of iris petal
- Species: species of iris

dim(iris)

```
## [1] 150 5
```

3.1.2 mpg

Some of the exercises are based on mpg dataset, taken from the ggplot2 package.

```
data("mpg")
```

This dataset contains the fuel economy data from 1999 and 2008 for 38 popular models of car. mpg dataset contains the following variables:

- manufacturer
- model
- displ: engine displacement, in litres
- year
- cyl: number of cylinders
- trans: type of transmission
- drv: drivetrain type, f = front-wheel drive, r = rear wheel drive, 4 = 4wd
- cty: city miles per gallon

3.1. DATA 23

```
• hwy: highway miles per gallon
```

• fl: fuel type

dim(mpg)

[1] 234 11

head(mpg)

```
## manufacturer model displ year cyl trans drv cty hwy fl class

str(mpg)

3.2 Scatterplot

Let us consider iris dataset.

3.2.1 Exercise 1

- a. Generate a scatterplot to analyze the relationship between Sepal.Width and Sepal.Length variables.
- b. Set the size of the point as 3 and their colour (colour and fill arguments as "green").

3.2. SCATTERPLOT 25

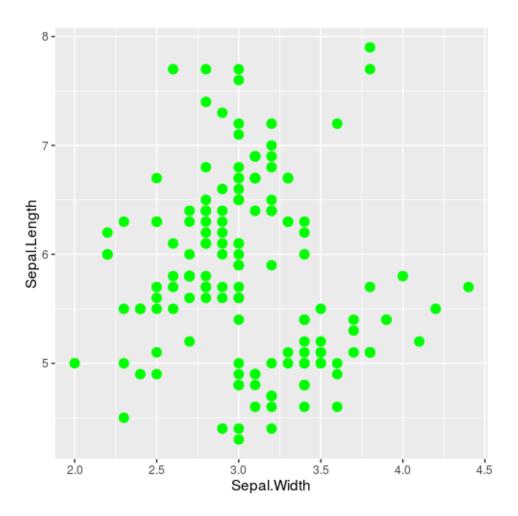

Figure 3.1:

3.2.2 Exercise 2

a. Generate a scatterplot to analyze the relationship between Petal.Width and Petal.Length variables according to iris species, mapped as colour aes.

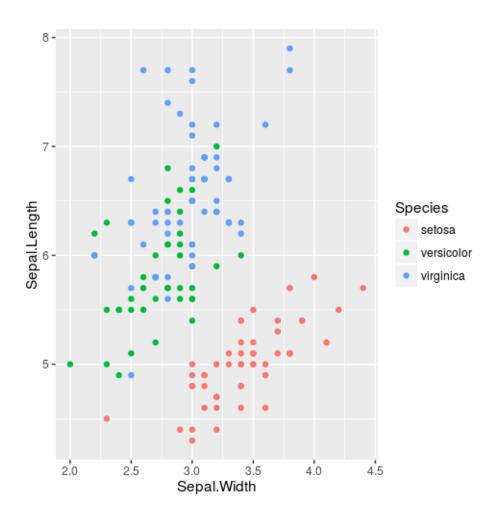

Figure 3.2:

3.3. BOX PLOT 27

3.3 Box Plot

Let us consider iris dataset.

3.3.1 Exercise 1

a. Build a box plot to compare the differences of sepal width accordingly to the type of iris species.

- b. Set the fill colour of boxes as "#00FFFF", the lines colour of boxes as "#0000FF" and the outliers colour as "red".
- c. Add the plot title: "Boxplot of Sepal.Width vs Species"

```
pl <- ggplot(data=iris, aes(x=Species, y=Sepal.Width)) +
   geom_boxplot(fill="#00FFFF", colour="#0000FF", outlier.colour = "red") +
   ggtitle("Boxplot of Sepal.Width vs Species")
pl</pre>
```

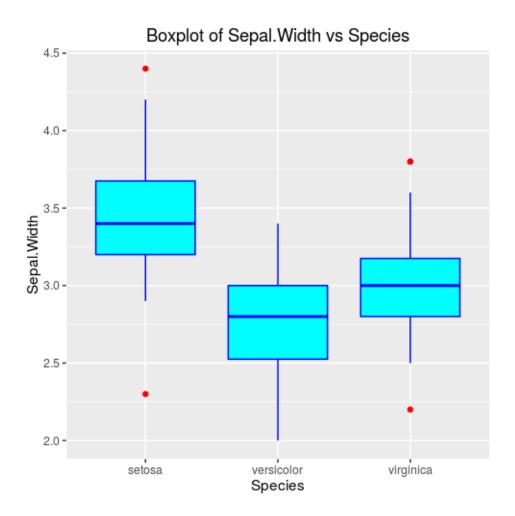

Figure 3.3:

3.4. HISTOGRAM 29

3.4 Histogram

Let us consider iris dataset.

3.4.1 Exercise 1

- a. Represent the distribution of ${\tt Sepal_Length}$ variable with an histogram.
- b. Set bins fill colour as "hotpink" and bins line colour as "deeppink".
- c. Set the number of bins as 15.

```
pl <- ggplot(data=iris, aes(x=Sepal.Length)) +
    geom_histogram(fill="hotpink", colour="deeppink", bins=15)
pl</pre>
```

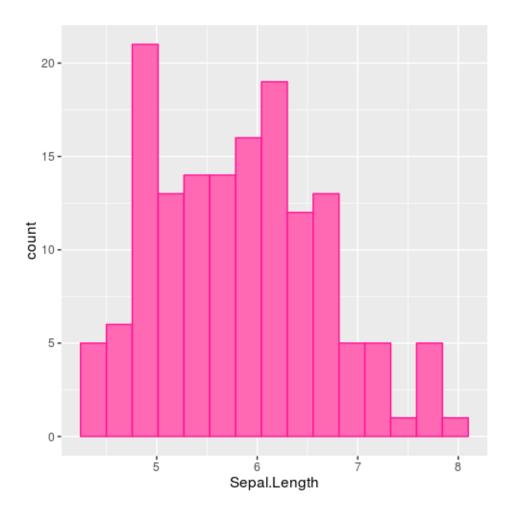

Figure 3.4:

3.5. LINE GRAPH 31

3.5 Line graph

3.5.1 Exercise 1

Let us suppose that the observations on iris are taken along time. So let us consider the following dataset, named iris2, in which time variable is added:

```
require(dplyr)
iris2 <- iris %>% mutate(time=1:150)
```

a. Build a line graph to visualize the measures of Sepal.Length variable along time.

```
ggplot(data = iris2, mapping = aes(y=Sepal.Width, x= time)) + geom_line()
```

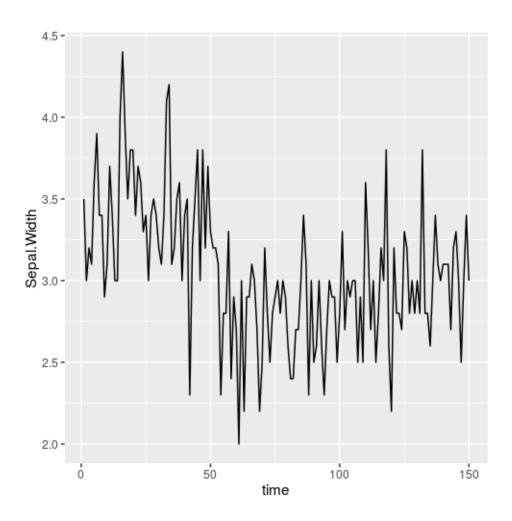

Figure 3.5:

3.5.2 Exercise 2

Let us suppose that the observations on iris are taken along time. So let us consider the following dataset, named iris3, in which time variable is added:

```
iris3 <- iris %>% mutate(time=rep(1:50, times=3))
```

- a. Build a line graph to visualize the measures of Sepal.Length variable along time, according to the Species variable, mapped as colour aes.
- b. Set linetype as "twodash".

```
ggplot(data = iris3, mapping = aes(y=Sepal.Length, x= time, colour=Species)) +
  geom_line(linetype=6)
```

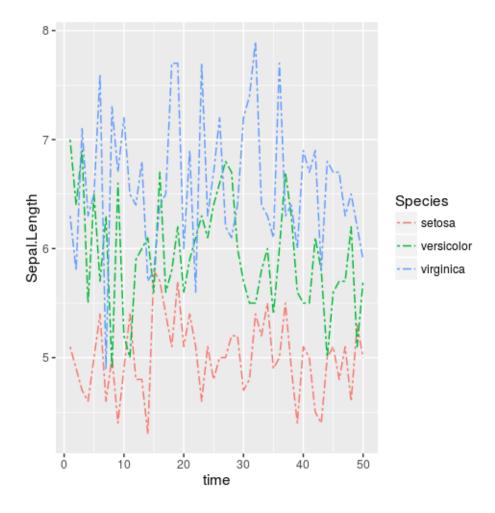

Figure 3.6:

3.6. BAR GRAPH

3.6 Bar graph

Let us consider mpg dataset.

3.6.1 Exercise 1

- a. Represent graphically with a bar graph how many cars there are for each class.
- b. Represent horizontal bars and set bars width as 0.6.

```
pl <- ggplot(mpg, aes(class)) +
        coord_flip() +
        geom_bar(width=0.6)
pl</pre>
```

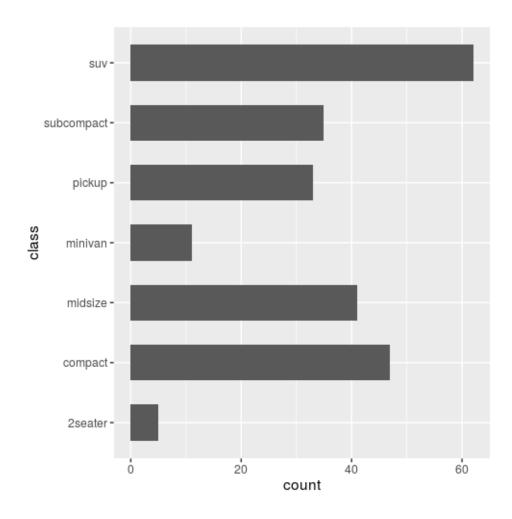

Figure 3.7:

3.6.2 Exercise 2

a. Represent graphically with a bar graph how many cars there are for each class according to manifacturer.

```
pl <- ggplot(mpg, aes(class, fill=manufacturer)) +
   geom_bar()
pl</pre>
```

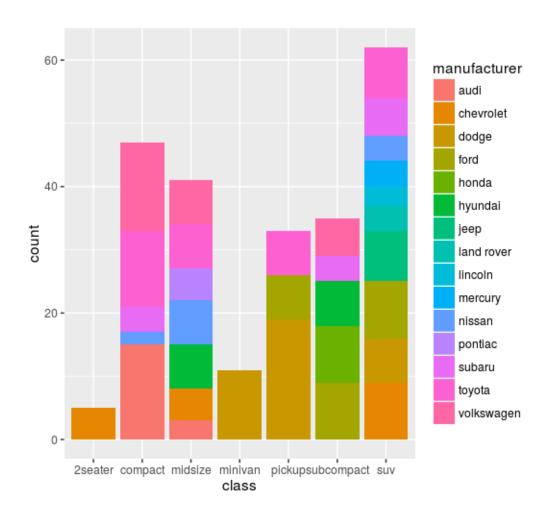

Figure 3.8:

3.6. BAR GRAPH 35

b. Represent graphically with a bar graph, the distribution of manifacturer or each class (set position argument of geom_bar).

```
pl <- ggplot(mpg, aes(class, fill=manufacturer)) +
   geom_bar(position ="fill")
pl</pre>
```

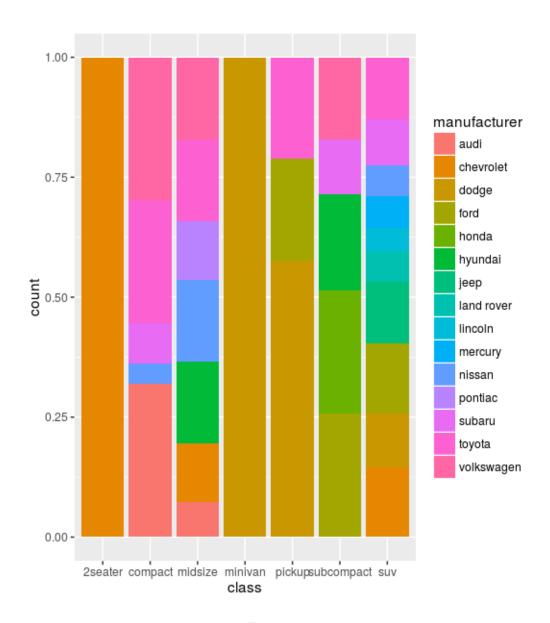

Figure 3.9:

Chapter 4

Writing R functions

4.1 Exercise 1

Write a function, named $compute_summary$, which computes: sum, subtraction, multiplication and division of two numbers. The function arguments should be the two numbers, named as: x and y. The function should return all amounts computed.

```
compute_summary <- function(x, y){</pre>
  sum_op <- x+y
  sub_op <- x-y
 mul_op <- x*y</pre>
 div_op <- x/y
 return(list(sum_op=sum_op, sub_op=sub_op, mul_op=mul_op, div_op=div_op))
compute_summary(x=4, y=2)
## $sum_op
## [1] 6
## $sub_op
## [1] 2
## $mul_op
## [1] 8
## $div_op
## [1] 2
compute_summary(x=3, y=7)
```

```
## $sum_op
## [1] 10
##
## $sub_op
## [1] -4
##
## $mul_op
## [1] 21
##
## $div_op
## [1] 0.4285714
```

4.2 Exercise 2

Write a function, named compute_gain, which computes the income by multiplying the amount produced for sale price and then computes the gain by subtracting the costs to income. The function arguments should be: amount, price, and costs; price should have a default value equal to 5. The function should return the gain.

```
compute_gain <- function(amount, costs, price=5){
  income = amount * price
  gain = income - costs
  return(gain)
}

compute_gain(amount = 40, costs = 50)

## [1] 150

compute_gain(amount = 100, costs = 70, price = 1)

## [1] 30</pre>
```
