Introduction

In this document you will find some exercises with the tidyverse R packages. They are mainly based on the nycflights13 data, taken from the nycflights13 package.

1.1 Introduction to nycflights13 data

The nycflights13 package contains information about all flights that departed from NYC (e.g. EWR, JFK and LGA) in 2013: 336,776 flights in total.

```
require(nycflights13)
ls(pos = "package:nycflights13")

## [1] "airlines" "airports" "flights" "planes" "weather"
```

To help understand what causes delays, it includes a number of useful datasets:

- flights: information about all flights that departed from NYC
- weather: hourly meterological data for each airport;
- planes: construction information about each plane;
- airports: airport names and locations;
- airlines: translation between two letter carrier codes and names.

1.1.1 flights

This dataset contains on-time data for all flights that departed from NYC (i.e. JFK, LGA or EWR) in 2013. The data frame has 16 variables and 336776 observations. The variables are organised as follow:

- Date of departure: year, month, day;
- Departure and arrival times (local tz): dep_time, arr_time;
- Departure and arrival delays, in minutes: dep_delay, arr_delay (negative times represent early departures/arrivals);
- Time of departure broken in to hour and minutes: hour, minute;
- Two letter carrier abbreviation: carrier;
- Plane tail number: tailnum;
- Flight number: flight;
- Origin and destination: origin, dest;
- Amount of time spent in the air: air_time;
- Distance flown: distance.

1.1.3 airports

This dataset contains useful metadata about airports, that is:

- FAA airport code: faa;
- Usual name of the aiport: name;
- Location of airport: lat, lon;
- Altitude (in feet): alt;
- Timezone offset from GMT: tz;
- Daylight savings time zone: dst A = Standard US DST: starts on the second Sunday of March, ends on the first Sunday of November U = unknown N = no dst

The data frame has 7 variables and 1397 observations.

1.1.4 planes

This dataset contains plane metadata for all plane tailnumbers found in the FAA aircraft registry (American Airways (AA) and Envoy Air (MQ) report fleet numbers rather than tail numbers). The data frame has 9 variables and 3322 observations. The variables are organised as follow:

```
• Tail number: tailnum;
 • Year manufactured: year;
 • Type of plane: type;
 • Manufacturer and model: manufacturer, model;
 • Number of engines and seats: engines, seats;
 • Average cruising speed in mph: speed;
 • Type of engine: engine.

1.1.5 weather

This dataset is about hourly meterological data for LGA, JFK and EWR. The data frame has 14 variables and 8719 observations. The variables are organised as follow:

- Weather station: origin (named origin to faciliate merging with flights data);
- Time of recording: year, month, day, hour;
- Temperature and dewpoint in F: temp, dewp;
- Relative humidity: humid;
- Wind direction (in degrees), speed and gust speed (in mph): wind_dir, wind_speed, wind_gust;
- Preciptation, in inches: precip;
- Sea level pressure in millibars: pressure;
- Visibility in miles: visib.

Verb functions

In this section you will find exercises on the basic verbs of data manipulating provided by dplyr:

```
1. select();
2. filter();
3. arrange();
4. mutate();
5. summarise().

## Warning in .doLoadActions(where, attach): trying to execute load actions without
## 'methods' package
```

2.1 select() and its friends

Note: all the exercises of this section are based on the flights dataset.

```
require(tidyverse)
require(nycflights13)
## Loading required package: nycflights13
```

2.1.1 Exercise 1

Extract the following information about flights:

• month;

- day;
- air_time;
- distance.

require(nycflights13)

data(flights)

flights %>% select(month, day, air_time, distance)

```
## # A tibble: 336,776 \times 4
##
      month
                day air time distance

                                                                NA
## # ... with 11 more variables: arr_delay <dbl>, carrier <chr>, flight <int>,
## #
       tailnum <chr>, origin <chr>, dest <chr>, air_time <dbl>, distance <dbl>,
## #
       hour <dbl>, minute <dbl>, time_hour <dttm>
```

2.2.6 Exercise 6

Extract information about distance for all flights which delayed more than 1000 minutes at departure.

```
flights %>%
  filter(dep_delay > 1000) %>%
  select(distance)
```

```
## # A tibble: 5 × 1
## distance
## <dbl>
## 1 4983
## 2 719
## 3 483
## 4 589
## 5 2586
```

2.3 arrange()

Note: all the exercises of this section are based on the flights dataset.

```
library(dplyr)
library(nycflights13)
```

2.3.1 Exercise 1

Sort the flights in chronological order.

2.3.2 Exercise 2

Sort the flights by decreasing arrival delay.

2.3.3 Exercise 3

Sort the flights by origin (in alphabetical order) and decreasing arrival delay.

2.4 mutate() and its friends

Note: all the exercises of this section are based on the flights dataset. Times are in minutes and distances are in miles.

```
library(dplyr)
library(nycflights13)
```

2.4.1 Exercise 1

Add the following new variables to the flights dataset:

2.5. SUMMARISE() 25

• the gained time in minutes, defined as the difference between delay at departure and delay at arrival;

• the speed in miles per hour (distance / air_time * 60).

Show only the following variables: delay at departure, delay at arrival, distance, air time and the two new variables (gained time and speed).

2.4.2 Exercise 2

Redo the previous calculations keeping only the new variables.

2.4.3 Exercise 3

After sorting flights in chronological order, for each flight calculate the difference between its delay at arrival and the delay at arrival of the immediately previous flight. Have R showed only the delay variables (delay at departure, delay at arrival and the new variable).

2.4.4 Exercise 4

For each flight calculate the 'min ranking' in terms of delay at arrival.

2.4.5 Exercise 5

For each flight calculate the 'first ranking' in terms of delay at arrival.

2.4.6 Exercise 6

Create a variable which indicates if each flight took off more than -4 or less than 4 minutes late.

2.5 summarise()

Note: all the exercises of this section are based on the flights dataset.

```
library(dplyr)
library(nycflights13)
```

2.5.1 Exercise 1

Calculate minimum, mean and maximum delay at arrival.

2.5.2 Exercise 2

Calculate minimum, mean and maximum delay at arrival for flights in January.

2.5.3 Exercise 3

Calculate the number of flights and the number of carriers

Grouping data

3.1 group_by()

Note: all the exercises of this section are based on the flights dataset.

```
library(dplyr)
library(nycflights13)
```

3.1.1 Exercise 1

Calculate number of flights, minimum, mean and maximum delay at arrival for flights by month.

3.1.2 Exercise 2

Calculate number of flights, mean delay at departure and arrival for flights by origin.

3.1.3 Exercise 3

Calculate the number of planes and the number of flights that go to each possible destination.

3.1.4 Exercise 4

Calculate the number of flights for each day. Save the result in a data frame called per_day.

3.1.5 Exercise 5

By exploiting per_day, calculate the number of flights for each month. Save the result in a data frame called per_month.

3.1.6 Exercise 6

Calculate the mean daily number of flights per month.

Do

4.1 do

Note: all the exercises of this section are based on the flights dataset.

```
library(dplyr)
library(nycflights13)
```

4.1.1 Exercise 1

Calculate quartiles (25-, 50- and 75-percentiles) of delay at arrival per origin. Put all three quartiles in a unique column.

4.1.2 Exercise 2

Redo the previous exercise putting the three quartiles in three different columns (hint: use summarise()).

4.1.3 Exercise 3

Calculate mean and standard deviation of delay at arrival per origin. Put both statistics in a unique column.

4.1.4 Exercise 4

Redo the previous exercise putting mean and standard deviation in two different columns (hint: use summarise()).

30 CHAPTER 4. DO

Combining data

5.1 Joins: inner_join(), left_join(), right_join(), etc.

Note: all the exercises of this section are based on flights, airlines, airports or planes datasets.

```
library(dplyr)
library(nycflights13)
```

5.1.1 Exercise 1

Keep only the following variables of the flights dataset: month, day, hour, origin, destination and carrier. Save this dataset in a data frame and call it flights_red. Through a proper join command, add the carrier name to flights_red (this piece of information is available in airlines).

5.1.2 Exercise 2

Through a proper join command, add name, latitude, longitude and altitude of the origin airport to flights_red (these pieces of information are available in airlines). Do the same also for the destination airport. (If you are able to, try to keep variables about both origin and destination airports in the same final dataset).

5.1.3 Exercise 3

Through the inner_join() function, redo the same for the destination airport but keep only the flights whose information is available in both datasets (flights and airports).

5.1.4 Exercise 4

Redo the exercise 3 by using full_join() instead of inner_join(). What is the difference in the result?

5.1.5 Exercise **5**

Through the anti_join() function, extract all the flights from flights whose information about destination airport is not available in airports.

5.1.6 Exercise 6

Sort the planes dataset by increasing year. Then create two datasets: the first will deal with planes older than 2000; the second will deal with planes of 2000 or newer. Finally create a unique dataset where the first rows will deal with the newest planes, whereas the last rows will deal with the oldest planes.

Tidy data with tidyr

6.1 tidyr

```
library(dplyr)
library(tidyr)
library(nycflights13)
```

6.1.1 Exercise 1

Consider the following dataset:

```
heartrate_wide <- data.frame(</pre>
  name = c("Aldo", "Giovanni", "Giacomo"),
  surname = c("Baglio", "Storti", "Poretti"),
  morning = c(67, 80, 64),
  afternoon = c(56, 90, 50)
heartrate_wide
##
         name surname morning afternoon
## 1
                            67
         Aldo Baglio
## 2 Giovanni Storti
                            80
                                      90
## 3 Giacomo Poretti
                                      50
```

It represents the heart rate measured to three patients in the morning and in the afternoon. The dataset is in the wide format: change it to the long format through a proper tidyr function. Save the result in a data frame and call it heartrate_long.

6.1.2 Exercise 2

Starting from heartrate_long, come back to a dataset in a wide format through a proper tidyr function. The result should be obviously equal to heartrate_wide.

6.1.3 Exercise 3

Consider the dataset heartrate_wide and unite name and surname of the patients in a unique column through a proper tidyr function. Save the result in a new data frame called heartrate_united.

6.1.4 Exercise 4

Starting from heartrate_united, come back to a dataset where name and surname are in two different columns through a proper tidyr function. The result should be obviously equal to heartrate_wide.

Warning in .doLoadActions(where, attach): trying to execute load actions without
'methods' package

Handling Missing values

```
library(tidyverse)
```

7.0.1 Exercise 1

Consider the following dataset:

```
heartrate <- data.frame(
  name = c("Aldo", "Giovanni", "Giacomo", "Aldo", "Giovanni", "Giacomo", "Giovanni", "Giacomo"),
  surname = c("Baglio", "Storti", "Poretti", "Baglio", "Storti", "Poretti", "Storti", "Poretti"),
  when = c("morning", "morning", "morning", "afternoon", "afternoon", "afternoon", "evening", "evening",
```

It represents the heart rate measured on three patients in the morning, in the afternoon and in the evening. Make explicit any implicit missing value. How many missing values do you see?

heartrate %>% complete(surname, when, fill=list(name="Aldo"))

```
## # A tibble: 9 × 4
    surname
              when
                       name heartrate
                             <dbl>
##
    <fctr>
              <fctr> <fctr>
## 1 Baglio afternoon
                     Aldo
                                   56
## 2 Baglio evening
                       Aldo
                                   NA
## 3 Baglio morning
                       Aldo
                                   67
## 4 Poretti afternoon Giacomo
                                   50
## 5 Poretti evening Giacomo

```

```
# one missing value
# alternatively:
# heartrate %>%
# complete(surname, when) %>%
# fill(name)
```

7.0.2 Exercise 2

Import data in the file marks.Rdta. Missing values have been recorded as ".". What's the percentage of missing values in the data? Replace them with NA and drop them.

```
marks_NA <- na_if(marks, ".")</pre>
marks_NA %>%
  filter(is.na(marks)) %>%
  summarise(n())/30
##
            n()
## 1 0.06666667
# 0.067% missing, only one variable, we may drop missing obs
marks_NA %>% drop_na()
## # A tibble: 28 × 1
##

## # ... with 18 more rows
```

7.0.3 Exercise 3

Import the data heartrate_NA.Rdta. Consider all the missing values you find and replace them using the function fill() when possible.

```
heartrate_NA %>%
  na_if( "") %>%
  fill(name, surname)
```

Warning in .doLoadActions(where, attach): trying to execute load actions without
'methods' package

Manipulating strings with stringr

```
library(tidyverse)
library(stringr)
```

8.0.1 Exercise 1

Import the data aire_milano_strings.txt which is a tab delimited file. Find how China has been codified (notice that the file is in Italian) and manipulate that string as you find more confortable for you. Save the results in a new tibble.

```
## Parsed with column specification:
## cols(
## Residenza = col_character(),
## MotivoIscrizioneEstero = col_character(),
## Num = col_integer()
## )

aire %>% filter(str_detect(Residenza, c("Cina"))) # not recorded as Cina
## # A tibble: 0 × 3
## # ... with 3 variables: Residenza <chr>, MotivoIscrizioneEstero <chr>,
## # Num <int>
aire %>% filter(str_detect(Residenza, c("cina"))) # not recorded as cina
## # A tibble: 0 × 3
## # ... with 3 variables: Residenza <chr>, MotivoIscrizioneEstero <chr>,
## # Num <int>
```

8.0.3 Exercise 3

5

6

7

per matrimonio

per sentenza

trasferimento da AIRE

find all distinct reasons

Consider now the column with information on the reason for migrating. Count how many different reasons there are and notice that citizenship was recorded in two slightly different ways: "acquisto cittadinanza" and "per acquisto cittadinanza". Replace one of them so that they are the same.

```
aire_clean %>% distinct(MotivoIscrizioneEstero)
## # A tibble: 8 × 1
        {\tt MotivoIscrizioneEstero}
##
##
                          <chr>>
## 1
               all'emigrazione
## 2
                   per nascita
## 3
     per residenza all'estero
## 4
         acquisto cittadinanza
## 5
                per matrimonio
## 6
         trasferimento da AIRE
## 7 per acquisto cittadinanza
## 8
                  per sentenza
aire_clean <- aire_clean %>% mutate(MotivoIscrizioneEstero = str_replace(MotivoIscrizioneEstero, c
# now you only have 7 different levels
aire_clean %>% distinct(MotivoIscrizioneEstero)
## # A tibble: 7 × 1
##
        MotivoIscrizioneEstero
##
                          <chr>
## 1
               all'emigrazione
## 2
                   per nascita
## 3 per residenza all'estero
## 4 per acquisto cittadinanza
```
